# **Description of Map Units**

# **QUATERNARY SYSTEM**

# HOLOCENE

Holocene undifferentiated alluvium—Undifferentiated deposits of small upland streams: unconsolidated alluvial deposits of minor streams and creeks filling valleys incised into older deposits, with textures varying from gravelly sand to

Small river meander-belt deposits—point bar deposits underlying the meander Small river natural levee deposits—deposits forming low natural levees flanking

Backswamp deposits—fine-grained Holocene deposits of rivers, underlying the

Ouachita River meander deposits—point bar deposits underlying meander belts of the Ouachita River. Ouachita River natural levee deposits—deposits forming low natural levees flanking the meander belts of the Ouachita River. Where observed in the Monroe

area the sediments comprise grayish brown silty clay with well developed soil Ouachita River distributary deposits—sandy and silty sediments occupying

abandoned courses of a relict distributary system of the Ouachita River. In the Monroe area the sediments comprise yellowish to orangish brown silty very fine sand with varying though relatively small proportions of admixed clay. Ouachita River crevasse splay deposits—sandy and silty sediments forming

fanlike crevasse splays that originate from the Ouachita River. Where observed in

the Monroe area the sediments comprise interlaminated gray-brown silt and organic-rich, dark clavev silt. Arkansas River meander-belt deposits—point bar deposits underlying meander

Arkansas River natural levee deposits—deposits forming low natural levees flanking the meander belts of the Arkansas River.

Arkansas River distributary deposits— sandy and silty sediments occupying abandoned courses of a relict distributary system of the Arkansas River.

QUATERNARY UNDIFFERENTIATED

Quaternary colluvium—undifferentiated colluvial deposits forming lobate to apronlike landforms.

Quaternary alluvial-fan deposits—unnamed alluvial-fan deposits.

PLEISTOCENE

### PRAIRIE ALLOGROUP

belts of the Arkansas River.

Prairie Allogroup, undifferentiated—a diverse depositional sequence of late to middle Pleistocene deposits of the Mississippi River, its tributaries, and coastal plain streams; includes terraced fluvial (meander belt, backswamp, and braided stream), colluvial, estuarine, deltaic, and marine units deposited over a considerable interval (Wisconsin to Sangamon) of the late Pleistocene. Multiple levels are recognized along alluvial valleys and coast-parallel trends, and are grouped into two principal temporal phases. The allogroup is undifferentiated where local fluvial terrace remnants flank the more headward portions of stream

# INTERMEDIATE ALLOGROUP

Bentley alloformation—dissected alluvial deposits of early Pleistocene streams of primarily the Red River in central Louisiana. The unit is blanketed by yellow loam and incises Tertiary formations; it is incised by younger subunits of the Intermediate allogroup, and by the Prairie Allogroup and younger strata. Equivalent to the Natchez Formation of

# TERTIARY SYSTEM MIOCENE-OLIGOCENE

Catahoula Formation—texturally heterogeneous suite of generally poorly sorted sediments comprising primarily silt/siltstone to very fine quartzose sand/sandstone, with and without admixtures of clay. Overall or predominant grain size of sand/sandstone tends to average very fine to fine sand. Coarser grains may comprise quartz, chert, and/or mud clasts. Contains petrified wood and tuffaceous sandstone locally. Weathers locally to produce a thick (up to 2 meters) gray/tan loamy surface unit. Characteristics of the surface Catahoula accord generally with continental, fluvial-dominated deposition (Fisk, 1940; Hinds, 1999), with the large proportion of silt observed in places suggestive of the onset of transition to deltaic facies (McCulloh and Heinrich, 2002). Recent work indicates a palynological age of early late Miocene for the Catahoula in its type area in eastern north Louisiana (Wrenn et al., 2003), in contrast to the Oligocene age suggested by subsurface-to-surface correlation in the Texas Gulf Coast (Galloway, 1977, Galloway et al., 1982).

Open Water, Inundated Area, Wetland

**Contact**—includes inferred contacts.

This research is supported by the U. S. Geological Survey, National Cooperative Geologic Mapping Program. The views and conclusions

This map has been carefully prepared from the best existing sources available at the time of preparation. However, the Louisiana Geological Survey and Louisiana State University do not assume responsibility or liability for any reliance thereon. This information is provided with the understanding that it is not guaranteed to be correct or complete, and conclusions drawn from such data are the sole responsibility of the user. These geologic quadrangles are intended for use at the scale of 1:24,000. A detailed on-the-ground survey and analysis of a specific site may differ from these maps.
